## Remote management system

Remote Touch Display to be installed in the premises or building that allows the management of the incidents of the fire detection and alarm system with a very reduced training of the personnel.

The display is designed to be placed in an accessible place for the personnel responsible for the installation, allowing a very simple, clear and intuitive visualisation of the alarms, faults and disconnections of the fire detection and alarm system.

In case of events, the user can perform immediate predetermined actions according to the reported events, such as resetting the event, stopping the sounders or evacuation.

Due to its simplicity in the presentation of information and action on the events, the staff needs very little training to use it, which makes it very practical, useful and effective in emergency and stress situations.
