

COFEM INSTALLER

ANDROID APP'S

Android application for setup configuration

Effortless installation, thus preventing errors and saving time

Following Cofem's philosophy based on the simplicity and reliability of its systems, the "COFEM Installers" app has been created, with the purpose of gathering the installation data required for the quick and easy configuration of the algorithmic addressable fire detection and alarm control panels, in three steps:

- 1- Open the application.
- 2- Create a new installation.
- 3- Scan the QR codes of the components (detectors, call points, etc.)

With this application you can carry all the information around with you without needing to make notes on pieces of paper, also avoiding any possible reading and writing errors. The information on the installations can also be sent or received by any means available on the phone/tablet to configure the installation's settings with the EasyCoNET / I-Link programme.
